## Background

CRVS systems are key to achieving the Sustainable Development Goals (SDGs)

- Improved child mortality
- Better education (SDG 4)
- Gender equality (SDG 5)
- Decent work (SDG 8)
- Reduced inequality (SDG 10)
- Justice (SDG 16)
- Partnership (SDG 17)

## 1. Overview

### About

This publication is for international development practitioners, both in programme and ICT divisions, who wish to understand and implement digitalised civil registration and vital statistics (CRVS) programmes. These findings highlight a selection of CRVS platforms. The platforms were selected after due consultations with stakeholders on existing CRVS offerings. Conducted by UNICEF (via a 3rd party vendor), the review assessed the functional and non-functional aspects, as well as maturity, of CRVS products.

The scope of this publication has limitations related to a) the exclusion of home-grown solutions and b) reliance on self-reporting by the vendors.

This publication is relevant to UN, government, and NGO actors. It is intended to guide planning, budgeting, technology selection, and implementation strategies. It is also intended to support planning and programme operations design that are fit for purpose and uphold value, feasibility, and sustainability principles.

An effective CRVS system is critical for tracking vital life events - including birth registration, which is a fundamental right. Civil and Political Rights are upheld through birth registration, which provides evidence of a person's existence and legal status, including nationality and family relationships. This is particularly important for underserved populations.

Furthermore, a dependable data source is essential for governments to assist policymakers in making informed decisions. CRVS systems can provide data on population dynamics, such as birth rates, death rates, and migration patterns, which are crucial for planning and resource allocation. This data can also inform policies related to healthcare, education, and social welfare.

The UN Secretariat has developed a series of [handbooks](#) to support countries in implementing CRVS systems. These handbooks provide practical guidance on various aspects of CRVS implementation, from initial planning to operationalization. They cover topics such as data collection, data management, data sharing, and data analysis. The handbooks are designed to be user-friendly and accessible to a wide range of stakeholders, including government officials, NGOs, and other development partners.

## CRVS Digitisation

## 2. CRVS Digitisation Needs and Challenges

Digital technologies offer unique opportunities to improve CRVS systems. Pages 8 and 9 show a diagram of an ideal, integrated CRVS system.

# Civil Registration, Vital Statistics and Identity Management

Once the CRVS digital system is up and running, there can be obstacles to capturing digital data accurately at the point-of-registration, as well as production of vital statistics from national databases dynamically updated with data from local registry offices.

Furthermore, the process of digitising CRVS systems may face an implementation hurdle as decision-makers may not anticipate sufficient tangible benefit in the near term to justify the project. Sustainable investment for CRVS systems relies on creating a stronger business case based on buy-in for the long-term advantages of digital infrastructure. This includes highlighting benefits that can be gained, such as improved accuracy, efficiency, and accessibility of data. All of these ultimately lead to more informed planning, decision-making, and resource allocation.

One way to counter common challenges is to use a systematic methodology for organising and prioritising product requirements at the onset of a CRVS digitisation project. This approach can play a key role in the development of product specifications. Strong specifications meet the needs of all stakeholders, including the decision-makers. These validated specifications also help ensure that the most critical requirements are given the highest priority. Understanding priorities in turn feeds into a detailed and realistic plan for how the project will be designed and implemented.

Requirement Hierarchy is one such product methodology. It begins with the high-level requirements. These feed into the user and then the system requirements. The benefit is to avoid starting with technical solutions that need to fit into a context.

### Requirements Hierarchy Methodology

High-Level	Business Requirements	Why is the project needed?
User-View	User Requirements	What do stakeholders need the system to do?

## 3. Assessment Digital I

Success in a CRVS digitisation project is crucial. It is crucial for supporting a digital CRVS pilot at a sub-national level so there is a path to success.

- Some key factors to be considered include:
- **Legal and regulatory**: support the digitisation related to data privacy

- **Human resource capacity.** Sufficient human resource capacity must be available to implement and maintain the digital CRVS system. This includes having the necessary technical expertise, training, and capacity building for staff involved in the system.

- **Digital infrastructure.** The digital infrastructure must be sufficient to support the implementation of the digital CRVS system. This includes ensuring the necessary hardware, software, and network infrastructure.

- **User requirements.** The user requirements of the digital CRVS system must be understood and incorporated into the design of the system. This includes considering the needs of end-users such as civil registration officials, medical professionals, and the general public.

Understanding these opportunities and limitations enables the identification of suitable CRVS platforms that can be implemented in a digitisation project. This ensures that the technology chosen is relevant to the country's specific circumstances and increases the likelihood of the project's success.

#### **Checklist of CRVS platform functional requirements**

- Notification
- Declaration
- Validation
- Registration
- Corrections and Amendments
- Certification
- Archiving
- Sharing data
- Performance monitoring

**Non-functional requirements** relate to how it is built and the steps involved in civil registration.

## **Assessment of core functional and non-functional requirements in CRVS platform**

- Interoperability.** E.g., platforms using application programming interfaces (APIs) for data exchange
- Scalability.** E.g., platforms able to handle increasing amounts of data and users
- Portability.** Cross-platform compatibility
- Performance.** Monitoring and reporting performance metrics

### Checklist of CRVS digital

- Availability.** Maximum 12hrs downtime per year; online/offline access.
- Traceability.** Track and record changes to data by system and users.
- Usability.** Intuitive and attention-grabbing design; prompts; viewable headers, labels and any software control values on page.
- Flexibility.** Extensibility and configurability options; dynamic forms that can be edited with ease.
- Archiving.** Capacity to archive all documents and legacy records permanently.
- Data extraction.** Ability to extract/import non-personally identifiable information from the system in a non-proprietary format.
- Messaging.** Capability to send automated messages to clients with reference numbers.
- Data.** Quality checks; format support of date, time, currency, number; disaggregation by age, sex, location; registration by time frames; UN recommended core data items; interactive dashboard
- Audit.** Logging of all activities and changes; permanent archiving; search logging; critical database tables changes logging.
- Authentication.** Role-based authentication required to access the system.
- Location.** Record of registration centres, unique IDs, location and geo-codes.
- Language.** Multi-language support.
- Security.** Unlimited roles, access levels; end-to-end data encryption; secure login and authentication; Two-factor authentication (2FA); role-based permission; no record deletion; data encryption plan; Multi-factor authentication (MFA); password storage; hardening standards; encryption of data at rest and in-transit; threat model; verification of secure components; generalized API developed with security

## Software maturity model

A maturity model can be a useful tool for organizations when selecting a solution. It provides a framework for assessing the capabilities and readiness of a particular option. A maturity model typically includes a set of defined levels or stages, each representing a progressively higher level of capability or maturity in each area, providing insights into the solution's strengths and weaknesses.

The use of a maturity model when selecting a CRVS digital platform facilitates well-informed decisions about the most suitable solutions for project requirements.

### CRVS platform maturity categories

Global utility	Country support	Software maturity	Human resources
Scalability	Governance & leadership	Adherence to best practices for digital development	Capacity for solution maintenance & support
Country utilization	User documentation		Capacity building
Community governance	Software productization	Adherence to privacy and applicable laws	
CRVS business requirements	Network of solution providers	Security and privacy	
Licensing and source code accessibility		Interoperability & data standards	
Open source		Multi-lingual support	
Total cost of			Software roadmap

## Deployment analysis

Scaling up a CRVS digital platform requires careful planning and analysis. This involves considering various factors such as:

- **Business objectives.** Evaluate the country's goals or limitations in terms of infrastructure, so as to determine the volumes of data, usage, and costs.
- **Technology.** Evaluate gaps or limitations in the current technology stack, so as to determine the required infrastructure, training, and support.
- **Resources.** Budget for the required human resources, taking into account the scale of the project.
- **Stakeholders.** Identify key stakeholders and their interests, so as to determine the required communication, collaboration, and buy-in.
- **Process.** Identify the required processes, so as to determine how the system will be implemented, monitored, and evaluated.
- **Data.** Determine the required data, so as to analyse and use it effectively.
- **Risk management.** Identify potential risks and develop mitigation strategies.

## Assessing total cost of ownership

While making the choice of the solution to procure, it is important to consider the Total Cost of Ownership (TCO), which extends well beyond the initial costs of setting up the CRVS digital platform selected.

Estimating the TCO involves considering all of the costs associated with the project over its entire lifecycle. This includes both direct and indirect costs. A direct cost is a specific expense that is just for the CRVS project, such as a software license. An indirect cost includes the more general resources that must be pulled to make the project work, such as IT staff time. TCO will examine hardware and software expenses, implementation and integration costs, maintenance and support costs, and any ongoing operational expenses.

It is important to note that the cost of implementing CRVS systems is highly dependent on the technological infrastructure of the country and the extent to which the CRVS process mapping has been completed. Consideration of the different scenarios that a country might face when embarking on a CRVS system is key to understanding how the cost structure will vary. This includes, for instance, accounting for the cost of establishing a CRVS system in a country without an IT unit in the CRVS authority, versus in a country with an existing national IT agency.

Additionally, it is necessary to factor in the time and resources required to complete the CRVS process mapping, which can take up to two years in practice. In sum, there is a need for an appropriate TCO estimation model to be developed for each country's unique scenario in order to ensure the most effective implementation of a CRVS system.

## Steps to estimate

- 1. Define the scope**  
identify the specific services required for the project
- 2. Identify the direct costs**  
implementing the services required for the project, such as training and any operations
- 3. Estimate the indirect costs**  
project, such as training and any operations
- 4. Calculate the total cost**  
estimate the total cost of the project
- 5. Consider the return on investment**  
benefits of the project and cost
- 6. Review and update**  
in the project scope, the estimate regularly. OpenCRVS, one of the projects, is a tool to support TCO

# DGIT

## Overview

Also, under consideration in the analysis was whether the CRVS solution is a Digital Public Good (DPG), or has high potential to become a DPG. The Digital Public Goods Alliance (DPGA) defines Digital Public Goods (DPG) as “open-source software, open data, open AI models, open standards, and open content that adhere to privacy and other applicable best practices, do no harm by design and are of high relevance for attainment of the United Nations 2030 **Sustainable Development Goals (SDGs)**.” Of the platforms reviewed here, DHS2 and OpenCRVS are DPGs. DGIT, EveLIN, and HERA are proprietary, although DGIT shares its code with its partner governments.

CRVS Platforms listed in this section were those that provided sufficient data in response to UNICEF assessments, based on criteria as outlined in the previous section. They also fulfil most, and sometimes all, of the requirements of a Digital Public Good. For a full list of Core Functional and Non-Functional requirements assessed, please see the Appendices at end of this document.

From a compliance perspective, all platforms below work out-of-box to support a majority of functional and technical (non-functional) requirements of a CRVS digital system. Each platform can also be configured within certain parameters to meet specific programme needs. Configuration level of effort ranges from light to medium depending on the type of functionality required.

Below is a summary of key findings:

- The eCRVS market is fragmented with no clearly recommended solution. No solution has reached multi-country adoption.
- The Total Cost of Ownership (TCO) varied widely, between US\$270,000 and US\$61.5 million. The variance is largely due to some solution providers not considering all required cost drivers.
- Implementation of interoperability or data standards between eCRVS and other solutions like Health and Identity is inconsistent.

## Technical Analysis

### Strengths

- Developed as a generic CRVS solution integrated with identity management.
- Can undertake all day-to-day operations online and offline mode.
- Adheres to 8 out of 9 Principles of CRVS Development.
- Fully implemented in two phases, with the third phase currently being rolled out.
- Budgets are available in phases.
- Already aligned to the UNCRVS and ID Management standards.
- Integrated CRVS and ID Management systems.

## DHIS2

### Overview

First released in 1996, **DHIS2** is a robust, open-source web-based platform for data collection, management, and analysis. DHIS2 is the world's largest Health Management Information System (HMIS) platform. 3.2 billion people (40% of the world's population) live in countries where DHIS2 is used as a Health Information Management System.

### Technical Analysis

Strengths	Weaknesses
<ul style="list-style-type: none"><li>Well-grounded solution and widely used in health sectors in many LMICs, including sending notification of vital events from health facilities to external CRVS systems</li><li>Comes with open license and provides source code freely</li><li>Can function in both offline and online mode</li><li>Adheres to all the Principles of Digital Development</li><li>Supports interoperability through <b>fast health information resource</b> (FHIR) data standards and other integration tools.</li></ul>	<ul style="list-style-type: none"><li>Lower levels of compliance with functional core requirements, particularly around registration and validation</li><li>Is yet to evolve as a core CRVS software, although has been tried out in a limited way in Liberia</li></ul>

**Country deployments:** Liberia (in progress).

## EveLIN

### Overview

**EveLin** is a proprietary system for vital records and statistics. A French civil registry system, EveLIN is market. The EveLIN is

### Technical Analysis

Strengths	Weaknesses
<ul style="list-style-type: none"><li>High level of compliance with functional non-functional core requirements</li><li>High state of readiness for functions of registration</li><li>Supports a number of data FHIR for interoperability</li><li>Deployed in France in over population from 50000 to 100000 and in the Overseas Territories</li><li>Solution available in different arrangements:</li><li>Buying a product with benefit of product &amp; support under an MCO contract</li><li>Buying a turnkey solution own the source code</li><li>Co-develop the solution code, and build capacity</li><li>Offline and Online version</li></ul>	

Pilots and field tests: Bangladesh, Niue, Nigeria, Cameroon.

## OpenCRVS

### Overview

OpenCRVS is an open-source, standards-based software for civil registration that is designed to work in low resource settings. OpenCRVS is a DPG.

### Technical Analysis

Strengths	Weaknesses
<ul style="list-style-type: none"><li>High level of compliance with core requirements</li><li>84% of the mandatory core requirements available 'Out of the box' signifying very high state of readiness</li><li>All the basic registration functions are available 'Out of the Box' and most of them can work in both offline and online modes</li><li>Open-source license made available and source code is publicly available</li><li>Supports data standards including FHIR for interoperability</li><li>Very high level of security features</li><li>Adheres to all the Principles of Digital Development</li></ul>	<ul style="list-style-type: none"><li>Covers birth and death registration. Marriage and divorce registration modules will be available in release 1.3, planned for May 2023.</li><li>Adoption will be available in 2024 based on demand for country implementation.</li><li>Relatively new platform without large scale implementation references.</li></ul>

## WCC (HERA)

### Overview

HERA is a proprietary birth, death and marriage international best practice system. HERA integrates with other Functional Registers (such as health) in addition, it supports the various systems, as recommended by the World Health Organization.

Strengths	Weaknesses
<ul style="list-style-type: none"><li>Functions of registration can be used both offline and online mode</li><li>Modules can be all implemented one at a time, starting with the birth module</li><li>Cloud-based or on-premises possible</li><li>It supports the OSIA for implementation in DHIS2 system and for interfacing with other systems</li><li>Willing to deliver the source code to countries</li><li>Currently implemented in the initial stage of implementation</li><li>Data is encrypted in transit</li></ul>

## Recommendations

When considering procuring a platform that is already in use in other projects. By doing so, has been refined through the development of a reliable product.

In contrast, unproven platforms can help mitigate issues or unanticipated problems. By doing so, has been refined through the development of a reliable product.

Sometimes the implementation party IT services firm, services partner/supplier, implementation. Selecting a platform that is already in use in other projects. By doing so, has been refined through the development of a reliable product.

- Increase the likelihood of requirements and
- Gain more effective

# CRVS RFP example deliverables

Deliverable / Activity
<b>1. Inception Report.</b> Detailed planning document specifying how each activity will be executed. This will include a comprehensive work plan.
<b>2. Functional &amp; Technical Design Documentation.</b> Detailed design documents for the digital CRVS system, including details of how the application architecture promotes a flexible, scalable, secure and cost-effective development approach.
<b>3. Prototype.</b> Working prototype that demonstrates required functionality that can be field tested by end-users.
<b>4. Hardware and Operating System Requirements.</b> Clearly defined hardware and operating system requirements needed to support the digital CRVS system.
<b>5. System Integration.</b> Integration software that allows the integration of the digital CRVS system with XXX, as per the defined requirements.
<b>6. Application &amp; Integration Testing Plan.</b> Detailed plan for all system testing including component, application, integration and user acceptance testing (UAT).
<b>7. Application &amp; Integration Test Scripts.</b> Comprehensive test scripts that will be used to test the digital CRVS system in isolation and with other systems.
<b>8. Application &amp; Integration Testing &amp; Report.</b> <ul style="list-style-type: none"><li>Conduct component, application and integration tests (including test environment setup)</li><li>Support UAT (lab and field).</li><li>Detailed write up of the outcomes of all tests, including resolution plans for outstanding bugs/ issues and fulfilment of acceptance criteria.</li></ul>
<b>9. User training.</b> Insert description of required training, to which audience etc.
<b>10. User Manual.</b> Comprehensive and easy to read user manual in English and [OTHER LANGUAGES] including screenshots
<b>11. System documentation.</b> Comprehensive technical documentation including: <ul style="list-style-type: none"><li>Coverage: Code that is and is not documented is easily identifiable.</li></ul>

## Conclusion

Choosing a CRVS digital solution best suited to a country's deployment context is a complex decision. This summary of findings aims to help streamline this process and to suggest the key questions to answer throughout the process.

For additional information, please contact UNICEF at the details below for updates to this publication, and/or for technical advice.

- **Digital Centre of Excellence** - Information and Communication Technology Division at [dcoe@unicef.org](mailto:dcoe@unicef.org)

# Appendices

## Core functional requirements assessed

### Administrative

- The system must be able to create, edit, delete system user
- The system must be able to define, assign and revoke system permissions for user(s)
- The system must allow task management feature for users, such as grouping applications by completion/pending status
- The system must support various processes at the local registration office (entry of forms, manage approvals, identify gaps, etc.)
- The system must allow user management (create, update and deactivate system users and assign permissions from those users)

### Alerts

- The users are alerted on notifications, declarations received
- The system must be able to automatically detection and alert on duplicate records and provide options for merging or removal of records

### Amendment

- The system should allow changing/editing of records name change/correction, address change/correction, based on necessary documentation

### Certification

- The system should allow internal process for submission and approvals
- The system must be able to generate QR codes to verify legitimacy of the certificates
- The system must allow users to print paper forms and certificates for clients

### Client features

- Clients must be able to create and submit declaration form remotely using a client portal
- The system must allow clients to upload documents and certifications or link online fields, such as, ID numbers

- The system must have defined parameters
- The system must have registrations, issued
- Reports to have 2 and area of catchment
- Reports to be prepared as applicable

### Data Sharing

- The system must be able to share data
- The user must be able to receive notifications, confirmations

### Registration

- The users must be able to register
- On completion of the registration form in the pop-up box the users must allow the users to amend and correct the information
- The system is able to automatically update and deactivate system users
- The users must be able to automatically generate QR codes to verify legitimacy of the certificates
- The system must be able to automatically print paper forms and certificates for clients

### Searchability

- The user must be able to search for specific data

Validation

- The system must be able to validate submitted documents as proof using QR codes, bar codes, holograms, picture/selfie matching photo IDs, valid date of documents, etc
  - If the system identifies errors validation with notification, declaration data for consistency, completeness, errors. The system must prompt the user to update specific fields
  - The system must allow to accept or reject messages (eg notification/declaration from other sources) based on automated validation or user action for corrective action
  - The system must allow registration agents to raise corner cases via the system so they can be logged and tracked to resolution
  - The system must be able to validate submitted data against same items of information in accompanying documents

Data

- The system must be able to validate submitted documents as proof using QR codes, bar codes, holograms, picture/selfie matching photo IDs, valid date of documents, etc
    - If the system identifies errors validation with notification, declaration data for consistency, completeness, errors. The system must prompt the user to update specific fields
    - The system must allow to accept or reject messages (eg notification/declaration from other sources) based on automated validation or user action for corrective action
  - The system must allow registration agents to raise corner cases via the system so they can be logged and tracked to resolution
  - The system must be able to validate submitted data against same items of information in accompanying documents
  - The system must be able to validate submitted documents as proof using QR codes, bar codes, holograms, picture/selfie matching photo IDs, valid date of documents, etc
    - The system must currency, number,
    - The system must age, sex and location
    - The system must be able to validate submitted documents as proof using QR codes, bar codes, holograms, picture/selfie matching photo IDs, valid date of documents, etc
      - The system must managers to undo subsequently ide accordingly

## **Core non-functional requirements assessed**

Archiving

- The system must be able to archive all documents, including legacy birth and death records permanently

Audit

- The system must log all activities, changes, amendments by user, place and time.
  - The system will keep the log of all changes for at least 6 months, and then archive it.

## Flexibility

- The system must log all the searches performed by the user and the individual data accessed / viewed by the user. The logged information should include the user ID, machine ID, timestamp and respective information (search criteria, etc.)
  - All changes (including inserts and updates) to critical database tables are to be written to an audit table, recording the user initiating the change, the time and date of the change, and the before and after values.
  - The system must have the ability to search for any information stored in the system.
  - The system must be able to handle large amounts of data efficiently.
  - The system must be able to handle multiple users simultaneously.
  - The system must be able to handle different types of data (text, images, videos, etc.).
  - The system must be able to handle different types of queries (SELECT, INSERT, UPDATE, DELETE).
  - The system must be able to handle different types of transactions (ACID compliant).
  - The system must be able to handle different types of security requirements (authentication, authorization, encryption).
  - The system must be able to handle different types of scalability requirements (horizontal scaling, vertical scaling, cloud integration).
  - The system must be able to handle different types of performance requirements (response time, throughput, latency).
  - The system must be able to handle different types of reliability requirements (availability, uptime, failover).
  - The system must be able to handle different types of maintainability requirements (scalability, extensibility, modularity).
  - The system must be able to handle different types of compliance requirements (GDPR, CCPA, PCI DSS).
  - The system must be able to handle different types of audit requirements (audits, reviews, assessments).
  - The system must be able to handle different types of reporting requirements (dashboards, reports, analytics).
  - The system must be able to handle different types of monitoring requirements (logs, metrics, alerts).
  - The system must be able to handle different types of configuration requirements (parameters, settings, rules).
  - The system must be able to handle different types of deployment requirements (scripts, tools, automation).
  - The system must be able to handle different types of integration requirements (APIs, databases, systems).
  - The system must be able to handle different types of security requirements (authentication, authorization, encryption).
  - The system must be able to handle different types of scalability requirements (horizontal scaling, vertical scaling, cloud integration).
  - The system must be able to handle different types of performance requirements (response time, throughput, latency).
  - The system must be able to handle different types of reliability requirements (availability, uptime, failover).
  - The system must be able to handle different types of maintainability requirements (scalability, extensibility, modularity).
  - The system must be able to handle different types of compliance requirements (GDPR, CCPA, PCI DSS).
  - The system must be able to handle different types of audit requirements (audits, reviews, assessments).
  - The system must be able to handle different types of reporting requirements (dashboards, reports, analytics).
  - The system must be able to handle different types of monitoring requirements (logs, metrics, alerts).
  - The system must be able to handle different types of configuration requirements (parameters, settings, rules).
  - The system must be able to handle different types of deployment requirements (scripts, tools, automation).
  - The system must be able to handle different types of integration requirements (APIs, databases, systems).

Authentication

- The system must be able to conduct verification of input data with 3rd party sources
  - The System must be able to provide multi-language support
  - Allows training to be provided through the product, minimizing the need for in-person training and providing flexibility to training approaches and the release of new features.
  - Language Learning**
  - Location**
  - The system must maintain a record of all registration centers with their unique IDs, location and geo-codes

## Scalability

- The system must be accessible to users,
  - The system must obtain different sources of information
  - The system's technology must support projects
  - The system must be able to learn

Language

- The System must be able to provide multi-language support

Learning

- Allows training to be provided through the product, minimizing the need for in-person training and providing flexibility to training approaches and the release of new features.

Location

- The system must maintain a record of all registration centers with their unique IDs, location and geo-codes

Messaging

- The system must be able to send automated messages to clients regarding notifications, confirmations of submissions, when to travel to office to collect certificates etc. with reference numbers
  - The system must be able to perform as load (users and transactions) increase following microservice design.
  - The system transaction response to user data entry should be minimum 2 seconds (turn round time) and maximum 5 seconds (turn round time) on an online workstation
  - The system must allow users to monitor system availability and performance
  - The system can sync data with the main server (in case of offline use)
  - The system can auto generate global unique IDs (GUID) (alpha, numeric), linked to a national ID
  - The system must track and record all changes (update/add/delete) to the data by system and by users
  - The solution must create person centric records and ability to search and view vital events of a person
  - The system transaction response to user search should be minimum 2 seconds (turn round time) and maximum 5 seconds (turn round time) on an online generation (e.g., push)

standards should be used for all hypervisors, operating systems, web servers, database servers, network devices and other components of the solution.

- The solution provider should ensure that key controls are in place to facilitate encryption of data at rest and in-transit. The same controls should be in place for the data stored locally in the offline workstations. A data encryption plan should be included in their proposal that aligns with current global best practices. In addition, the solution provider should develop “a threat model” where all the possible threats are defined, distinguished and treated with priorities.
- The solution provider needs to demonstrate that their supply chain has robust controls to address specific threats to the integrity of hardware and software products throughout the product life cycle. The end goal is to provide a product that has been designed, developed, and delivered with integrated security at every phase of the product life cycle. All the components used (open-source libraries or third-party dependencies) that will be used in the proposed CRVS solution should be verified as secure. While compliance is not required, ISO 20243 can be used as a reference point with regards to the required control framework
- The solution provider shall provide a generalized API that is developed based on security best practices (e.g., OWASP Top 10 or equivalent), including key considerations for encryption, authentication, authorization, data validation, audit logging, quotas/throttling, data validation, audit logging, API gateways, etc.

## Traceability

- The system must track and record all changes (update/add/delete) to the data by system and by users

## Usability

- The use of the tool should be easy and intuitive in order to reach users with different levels of computer use experience.
- The system should be able to capture the user’s attention and motivate them to interact with it, exploring and benefiting from all its features.
- The system should be able to generate prompts for users on actions or document verifications
- The system must provide the option on every page of CRVS system to view the headings, menus, labels, and any software control values on any page
